

PROFESSIONAL SERVICES + FORWARD-DEPLOYED ENGINEERING

From first evidence to enterprise operating capability

A governed path for industrial asset, reliability, and maintenance teams to assess, prove, implement, and scale SyncAI - without surrendering engineering authority to AI.

01 ASSESS

Reliability Intelligence Assessment

Establish what current evidence proves, expose material gaps, and prioritize a governed 90-day action plan.

Assessment | US\$35,000 standard scope

02 PROVE

Industrial Decision Proof of Concept

Test SyncAI on a bounded decision, fleet, or site using agreed evidence, controls, acceptance criteria, and stop criteria.

Proof of concept | Customer-specific private offer

03 IMPLEMENT + SCALE

SyncAI Forward-Deployed Engineering

Operationalize authorized data, governed workflows, customer ownership, and accepted handoff in production.

Implementation | Customer-specific private offer

Each scope closes with a customer-owned decision: go, change, hold, or stop. There is no automatic expansion.

One governed ladder. One decision loop at every scope.

The commercial adoption ladder describes how customer scope expands. The product decision loop describes how work is governed inside every scope. They are connected, but they are not the same thing.

01

First Decision

Make one real question understandable, evidence-backed, and saveable.

02

RIA when needed

Establish readiness and evidence when the baseline is not already defensible.

03

Bounded proof

Prove fit and value against agreed acceptance and stop criteria.

04

Fleet or site

Move accepted workflows into a governed production scope.

05

Multi-site

Federate proven controls, methods, and learning without erasing local authority.

06

Enterprise

Standardize the operating model while preserving accountable decisions.

AT EVERY SCOPE

Ask -> Understand -> Save -> Prove -> Recommend -> Decide -> Approve -> Verify -> Collaborate -> Learn

THE EXPANSION DECISION

No usage level, enthusiasm signal, account activity, service milestone, or AI recommendation advances scope. A named customer authority records **go, change, hold, or stop** against accepted evidence, unresolved risks, and verification obligations.

RIA may be bypassed only when a validated baseline and counterfactual, named owners, authorized data, acceptance and stop criteria, and an approved governance/security boundary already exist.

Forward-Deployed Engineering, productized

SyncAI Forward-Deployed Engineering is the bounded Implementation offer. Named SyncAI practitioners work virtually with customer owners to configure an accepted operating capability. FDE is not a separate adoption rung and is not open-ended staff augmentation.

What the FDE team does

- Defines the approved solution and authority boundary.
- Connects authorized sources and preserves provenance.
- Configures tenant roles, workflows, and specialist roles.
- Establishes acceptance and verification methods.
- Supports adoption, training, and operating-runbook completion.
- Prepares evidence for the next Expansion Decision.

Authority the customer retains

- Engineering and engineer-of-record authority.
- Investment and risk-acceptance authority.
- Operating, maintenance, and work-execution authority.
- Safety, regulatory, and environmental accountability.
- Production credential, change, and release authority.
- Approval of consequential recommendations.

ACCEPTED FDE OUTCOME

An accepted engagement has an approved tenant, role, data, and authority boundary; governed integrations; configured workflows; measurable acceptance evidence; a customer-owned runbook and support route; training and handover evidence; unresolved obligations; and a recorded decision for the next scope.

FDE WILL NOT

No transferred authority

- Approve customer recommendations or accept customer risk.
- Act as the customer engineer of record.
- Change equipment, operating limits, or protection settings.

No uncontrolled execution

- Issue or close customer work orders.
- Operate or isolate customer equipment.
- Use data or credentials outside the authorized scope.

What accepted implementation leaves behind

Services use the same governed product records as the operating platform. They do not create a shadow evidence, decision, approval, value, or audit system.

Evidence stays attributable Facts retain source, provenance, freshness, approval, and verification status.	Recommendations stay advisory Rationale, assumptions, uncertainty, consequences, and missing evidence remain visible.
Approvals stay human Customer authority is named; service activity and AI output cannot approve consequential action.	Value stays honest Hypotheses are distinct from observed and verified value, with baseline and method attached.
Handover stays operational Runbook, support route, ownership, unresolved obligations, and continuity are accepted.	Learning stays reusable Verified outcomes and accepted lessons can inform the next decision and scope.

COMMERCIAL PATH

Professional services are delivered virtually through customer-specific Microsoft Marketplace private offers when available. The recurring SyncAI SaaS subscription remains the platform anchor. The private offer and signed agreement control price, markets, schedule, scope, data handling, responsibilities, acceptance, and exclusions.

The Reliability Intelligence Assessment has a US\$35,000 standard-scope reference and normally runs 6-8 weeks. Proof-of-concept and implementation pricing is customer-specific. Final terms always come from the approved order and private offer.

IMPORTANT

SyncAI does not guarantee savings, uptime, accuracy, failure avoidance, or return on investment. Results depend on authorized data, customer decisions, operating conditions, implementation, and verified observation. Marketplace availability is confirmed only by a live Microsoft listing and the applicable customer private offer.
